

Build your own arXiv digest with Claude Code

The idea. You describe what you want in plain English; Claude writes the code, runs it, checks it works, and explains what it did. You never need to read the code, though you can.

1. Build it (about 10 minutes)

In the Claude desktop app, open the **Code** tab, choose your empty `arxiv-digest` folder, and paste the recipe on the back of this sheet (or copy it from www.davidholmes.nl/arxiv-digest/recipe.txt).

Before pasting, set the permission mode (below the message box) to **Accept edits**, so that it doesn't ask before writing each file. It will still ask before running anything; read the request and click **Allow**. Everything happens in that one folder on your laptop.

Claude will interview you about your research. Give it your arXiv author page, or links to a few of your papers. Then it builds everything and shows you today's digest.

2. Tune it (5 minutes)

Read the digest. Then just tell Claude what's wrong, in your own words:

- *"Too much analytic number theory. Move it to 'not for me'."*
- *"Also follow math.GT."*
- *"This paper should have been in the top list. Why wasn't it?"*

Claude updates `interests.md`, a plain-text file you can also open and edit yourself. Tuning is where it gets good: expect a week of small corrections.

3. Make it come to you (5 minutes)

Tell Claude:

Set this up as a scheduled task that runs every weekday at 8:30: follow the instructions in DAILY.md in this folder (put its full path in the task).

Then find the task under **Routines** in the sidebar and click **Run now** once. If it asks permission for anything, choose **Always allow**, so that future mornings run without you.

Each morning you get a notification, and the digest appears in the sidebar under **Scheduled** (and in the `digests` folder). The app has to be open. If your laptop is asleep at 8:30, the digest runs when you next open it.

Good to know

- **Cost.** Nothing extra. Each morning's run uses a small part of your Claude plan's usage allowance.
- **Don't give it your email.** Claude can connect to Gmail, but this task reads a few hundred abstracts by strangers every day. A job that reads untrusted text shouldn't also hold the keys to your mailbox. The notification is enough.
- **Check before trusting.** For the first week or two, skim the "other titles" list at the bottom of each digest to see what it missed, and tell it.
- **It's yours.** The files are in your folder. Delete the folder and it's gone.

Where next

The same pattern works for other chores: describe the goal, let it build, run it, then correct it in plain English. Try: *"Here is the PDF of this term's seminar programme; make me a calendar file I can import."* Or: *"Here are photos of my handwritten lecture notes; turn them into a LaTeX file."*

The recipe (paste all of this into Claude)

I'd like a personal daily arXiv digest. Please build it in this folder, step by step, explaining briefly what you are doing as you go. I am not a programmer, so keep things simple.

1. **My interests.** Interview me with a few short questions: which arXiv categories I follow (e.g. math.AG), what my research is about, and names of people whose work I always want to see. If I give you my arXiv author page, read it. Write what you learn to `interests.md`, in plain language I can edit later, with a section for “must see”, “interesting”, and “not for me”.
2. **Fetching.** Write a small Python script, `fetch.py`, using only the standard library, that downloads today's new papers from the arXiv RSS feed for my categories (the address is <https://rss.arxiv.org/rss/> followed by the categories joined with +, e.g. <https://rss.arxiv.org/rss/math.AG+math.NT>). It should save each paper's title, authors, abstract, link and announcement type (new, cross-list or replacement) to `today.txt`. Check first that Python 3 is installed; if not, help me install it. Run the script to check that it works.
3. **The digest.** Write `DAILY.md`: instructions to yourself for the daily job. Run `fetch.py`, read `today.txt` yourself (no extra scripts to parse it), compare it against `interests.md`, and write `digests/` + today's date + `.md` containing the handful of papers I would most want to see (usually 3 to 10, fewer on a quiet day), each with its link and one sentence on why it matters *to me*. Mention replacements only if they look important. Then list the other titles briefly, so I can spot anything you missed. If the feed is empty (weekends, holidays), just say so. Each run should end by showing me the digest.
4. **First run.** Follow `DAILY.md` now and show me the digest. Read `today.txt` directly with your file-reading tool, in a few large chunks if it is long; do not write helper scripts to process it.
5. **Finish.** Tell me in two or three sentences how to change what counts as interesting (edit `interests.md`, or just tell you), and how to make this run every weekday morning.

Keep it small: a few files, no extra packages, nothing clever. The whole thing should take about ten minutes.
